DETAILED ACTION

1. Claims 1-18 are pending in this application.

Double Patenting

The nonstatutory double patenting rejection is based on a judicially created doctrine grounded in public policy (a policy reflected in the statute) so as to prevent the unjustified or improper timewise extension of the "right to exclude" granted by a patent and to prevent possible harassment by multiple assignees. See *In re Goodman*, 11 F.3d 1046, 29 USPQ2d 2010 (Fed. Cir. 1993); *In re Longi*, 759 F.2d 887, 225 USPQ 645 (Fed. Cir. 1985); *In re Van Ornum*, 686 F.2d 937, 214 USPQ 761 (CCPA 1982); *In re Vogel*, 422 F.2d 438, 164 USPQ 619 (CCPA 1970);and, *In re Thorington*, 418 F.2d 528, 163 USPQ 644 (CCPA 1969).

A timely filed terminal disclaimer in compliance with 37 CFR 1.321(c) may be used to overcome an actual or provisional rejection based on a nonstatutory double patenting ground provided the conflicting application or patent is shown to be commonly owned with this application. See 37 CFR 1.130(b).

Effective January 1, 1994, a registered attorney or agent of record may sign a terminal disclaimer. A terminal disclaimer signed by the assignee must fully comply with 37 CFR 3.73(b).

Claims 1, 6, 7, 12, 13 and 16 are rejected under the judicially created doctrine of obviousness-type double patenting as being unpatentable over claims 1, 10, 11, 16, 17 and 20 of U.S. Patent No. 6,728,764 B1. Although the conflicting claims are not identical, they are not patentably distinct from each other because they only present two differences: 1) the claims of 6,728,764 B1 do not elaborate the details of the client side of the claimed invention; and focuses on the elements of the intermediate systems such as the management interface processor, the system operations program and the logical console objects to provide an operations interface to the operating system; and 2) word variations explained on *Table a*.

Art Unit: 2144

Table a:

Application Number: 09/833,943

<u>Claim 16</u>. A computing arrangement for operating a data processing system, comprising: a data processing system including a plurality of partitions, each partition including a processor arrangement hosting an operating system;

a management interface processor coupled to the data processing system and hosting a plurality of logical console objects,

each logical console object coupled to a respective partition;

an operations server computer system hosting a plurality of instances of a system operations program,

each instance of the system operations program coupled to a respective logical console object;

one or more display stations hosting independently operable instances of a console view, each instance of the console view coupled to a selected instance of the system operations program and configured to provide a user interface for operating the data processing system, wherein the system operations program is configured to transmit data received from a console view to a respectively coupled logical console object and transmit data received from a logical console object to one or more instances of a console view.

Patent Number: 6,728,764 B1

Claim 16. An apparatus for operating a partitioned
▶data processing system, each partition including a processor arrangement hosting an operating system

which is coupled to a management interface processor, wherein the management interface processor is coupled to a network having one or more <u>workstations</u> coupled thereto, comprising:

means for instantiating on the management interface processor respective sets of logical console objects for each partition of the data processing system;

means for initiating on one or more selected ones of the workstations respective instances of a system operations program for the logical console objects;

means for <u>coupling</u> the instances of the system operations program to the <u>logical console objects</u>; and means for providing an operations interface for the partitions.

Claim Rejections - 35 USC § 103

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

- (a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.
- 2. Claims 1-18 are rejected under 35 U.S.C. 103(a) as being unpatentable over Zalewski et al (U.S. 6,647,508 B2), hereinafter 'Zalewski' in view Stedman et al. (U.S. 5,968,119), hereinafter 'Stedman'.

Regarding claims 1, 6, 7, 12, 13 and 16, Zalewski taught a data processing system including a plurality of partitions, each partition including a processor arrangement hosting an operating system (Fig. 2, column 4 lines 32-48) further comprising a limited console multiplexer 228, depicted in figure 2 and in column 7 lines 1-7, as well.

Zalewski did not teach an extended console access mechanism.

Stedman taught an extended console access mechanism in the form of a method and apparatus for accessing information of a data processing system, comprising: a management interface processor (server application framework) coupled to the data processing system and hosting a plurality of logical console objects (display control) (Fig. 13, column 19 lines 9-12), each logical console object (display control) coupled to

Art Unit: 2144

a respective partition (host computer) (Fig. 13, column 19 lines 9-12 and lines 32-35); an operations server computer system (server computer) hosting a plurality of instances of a system operations program (host extension), each instance of the system. operations program coupled to a respective logical console object (display control) (Figs. 13-14, column 19 lines 18-35); one or more display stations (client computer) hosting independently operable instances of a console view (browser) (Fig. 13, column 18 lines 38-41), each instance of the console view coupled to a selected instance of the system operations program and configured to provide a user interface for operating the data processing system (Fig. 13, column 18 lines 19-33), wherein the system operations program is configured to transmit data received from a console view to a respectively coupled logical console object and transmit data received from a logical console object to one or more instances of a console view (Fig. 13-14, column 19 lines 9-41). Examiner clarifies that Stedman's disclosure is not limited to a single client, for instance in column 4 lines49-54 it is stated that the preferred embodiments are suited for one or more client computers 104. Examiner clarifies that Stedman's disclosed browsers (see column 6 lines 39-44) used to interact with the host computers 106, are known to be independently operable as being capable of displaying independent documents liked to different hosts computers 106. It is further noticed that console objects are additionally commensurate with session objects inherently present in the host computers 106 every time a valid connection is opened from a client computer.

Page 5

It would have been obvious to one of ordinary skill in the art working with Zalewski at the time of the invention was made to modify the methods/systems of Zalewski with the teachings Stedman, in order provide an improved access method or system avoiding the limitations of the multiplexer 228 (Zalewski: column 1 lines 1-7). Zalewski invention relates mainly to the management of operating systems instances executing cooperatively with resources subdivided into partitions (see abstract), therefore the inclusion of a primitive consolidated console for the system partitions denotes a need to simplify the access to the different partitions; at the same time motivates the exploration of the art of providing simplified access mechanisms for a plurality of hosts instances. The combination would have benefited Zalewski by adding an extended console access mechanism (as taught by Stedman from column 18 lines 19 to column 19 line 41) to the data processing system including a plurality of partitions, each partition including a processor arrangement hosting an operating system (Zalewski: Fig. 2, column 4 lines 32-48).

Zalewski modified by Stedman is hereinafter referenced to as the combination.

Regarding claims 2, 8, 14 and 17, the combination further taught each instance of the console view is configured to display data received in a manner consistent with a <u>first respective set of configuration parameters</u> associated with the instance of the console view in the form of "templates" (Stedman: Abstract, column 3 lines 3-14 and column 15 lines 31-34), wherein Stedman recites:

"The invention also includes a process of determining whether a pre-existing instruction template corresponding to a host computer screen exists, and, if it does, sending the pre-existing instruction template to the client computer instead of creating a new set of instructions..."

The template recited by Stedman corresponds to configuration files (a "set of configuration parameters") well known in the art of terminal emulation in post-character-based systems and used to save user preferred <u>display/connection</u> parameters. Such parameters typically include font size, foreground and background colors, and other console configurable parameters that the end-user wants to have available as permanent parameters; thus avoiding to have to configure such parameters every time he/she logs in back to a particular system. Moreover, in the background of the invention, Stedman taught the use of emulation software (column 1 lines 30-45), known to have capabilities to save configuration files in the client computer.

Regarding claims 3, 9, 15 and 18, the combination further taught details regarding that each instance of the console view is configured to select a subset of data from data received as a function of a second respective set of configuration parameters associated with the instance of the console view and display the subset of data (Stedman: Abstract, column 3 lines 14-19), wherein Stedman recites:

"An instruction template may further include a pull data field that specifies information is desired from the host computer. When the server computer finds a pull data field, the information is retrieved, and inserted in the instruction template in place of the pull data field."

Art Unit: 2144

It can be appreciated that **the combination** first retrieves the screen data from the host computer and then parse or filter the fields presented in the screen space (**Stedman: column 15 lines 34-45**).

Regarding claims 4 and 10, the combination, further taught details wherein at least one of the one or more instances of the console view executes on a computer system other than the computer system on which the coupled instance of the system operations program executes (Stedman: Figs. 13-14, from column 18 line 19 to column 19 line 41 and column 5 lines 44-65 in reference to figure 1b). Notice that it is expressly disclosed one or more client computers 104 (Stedman: column 4 lines 49-54), coupled to a server computer 108, which in turn connects to a host computer 106 or, as modified to the partitioned data system 200 (Zalewski: Fig. 2, column 4 lines 32-48).

Moreover, the combination further taught a system independent from the systems running the partitioned data system 200 and hosting the console presentation software (Zalewski: Fig. 2, from column 7 lines 2-7).

Regarding claims 5 and 11, the combination additionally taught further initiating on one or more selected ones of the computer systems an operations interface program (column 1 lines 30-45 [depicting a system having the host connectivity functionally in the client side of a distributed data processing system]); receiving at the operations interface program a connection request from an instance of the console view; creating a connection with the instance of the console view (column 18

Page 9

Art Unit: 2144

lines 38-43); and transferring the connection with the instance of the console view from the operations interface program to an instance of the system operations program (column 18 lines 43-53). As illustrated above the combination taught all the elements of the claimed limitations. Although part of the elements are disclosed in a description of the stated of the art prior the invention disclosed by Stedman, it is appreciated that it would have been obvious for one of ordinary skill in the art working with the combination at the time of the instant claimed invention to further combine elements of the prior art with the invention of the combination, to send the requests from the browser or "console view" to a module located inside the client computer or in a separate system to further connect with the host computer or the partitioned data system.

Application/Control Number: 09/833,943 Page 10

Art Unit: 2144

Response to Argument

Applicant's arguments with respect to claim 1-18 have been considered but are moot in view of the new ground(s) of rejection.

Regarding Applicant's arguments in reference to the objection to the drawings, the drawings are accepted.

Art Unit: 2144

Conclusion

3. The prior art made of record and not relied upon is considered pertinent to applicant's disclosure. See attached PTO-892 for details. Applicant is encouraged to further review the background of the invention in references B and C listed in the attached form PTO-892.

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Rainier Suazo whose telephone number is (571) 272-3931. The examiner can normally be reached on Monday through Friday, 8:00-5:00...

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, David Wiley can be reached on (571) 272-3923. The fax phone number for the organization where this application or proceeding is assigned is 703-872-9306.

Information regarding the status of an application may be obtained from the Patent Application Information Retrieval (PAIR) system. Status information for published applications may be obtained from either Private PAIR or Public PAIR. Status information for unpublished applications is available through Private PAIR only.
